

# Bleeding Hell

By C.P

**We know** from Bio-distribution studies that the lipid nanoparticles concentrate in the ovaries with 24 times the concentration found in the blood within 48 hours of intra muscular injection.

**We know** that these lipid nanoparticles contain mRNA that generates the Spike protein, and that the Spike concentration peaks in the blood stream during the first 7 days after vaccination.

**We know** that the Spikes will bind strongly to ACE2 receptors - blocking the breakdown of Angiotensin II, and the consequent build-up of Angiotensin II causes narrowing of blood vessels and release of Thrombin – a coagulation agent.

**We know** that when blood vessels become narrower, and blood becomes thicker and more viscous then this results in clotting, and excessive clotting causes platelet depletion.

**So it's no surprise** that clotting and bleeding disorders will occur with particularly high intensity in the area of the ovaries and womb – where the lipid nano particles concentrate.

**So it's no surprise** that COVID vaccinations are followed by period irregularities and excessive, unexpected bleeding from the womb.
