

Pfizer Batch Pattern in Sweden

I downloaded a data package from "Folkhälsomyndigheten", equivalent to our CDC, and the data package contained every batch number Sweden has and will order with its expiration date. I made an excel file for Pfizer with all the batches with their corresponding ADVR from your data "Pfizer (outside USA)". I made a ggplot on RStudio with the batches on the X-axis and ADVR on the Y-axis, and I arranged the batches according to their expiration date (Every batch expires at the end of every month from March). I have given every batch that expires in the same month a specific color and as you can see, from the picture I have attached down below, the results are devastating.

Now, it is important to remember that this is data from all VAERS reports outside of the US but with the specific batch numbers shipped to Sweden. What I believe is that Pfizer has systematically shipped out specific batches which they themselves know the toxicity of and have received experimental results for every month, the batch number pattern is only one variable, I believe that the expiration date along with shipment is another one.

I will contact "Läkemedelsverket" (equivalent to our FDA) and ask for data of reported ADVR to the specific batches. I will follow up if they would send me it.

Best regards
